THE COMPANY

Started in 2017, Security and Analytics, LLC, is targeted at meeting the cybersecurity and data analytics needs of small to medium-sized companies, manufacturers, not-for-profits, and government agencies in Mississippi and surrounding states.

The company focuses on the development of specific strategies to aid your business in strengthening its cyber security through focusing on enterprise risk assessment (ERM). Vulnerability assessment and asset management begin the effort to identify vulnerabilities and threats to your organization. Targeted training in cyber security and key protection methods are used to improve employee knowledge. Penetration testing and vulnerability scans are used to identify where cyber security controls need hardening and where such concepts as multi-factor authentication and data encryption can strengthen your network and improve data protection.

Dr. Gordon W Skelton, President of Security and Analytics, holds a number of key certifications in cyber security and risk management: CISSP, CISA, CRISC, CEH, Security+

ANALYTICAL RESEARCH

CYBER SECURITY

Cyber Security is a critical issue for all businesses today. Threats are present and attackers are actively seeking to identify companies and government agencies with weaknesses and vulnerabilities. Ransomware is a common tool of these actors, looking for a easy way to prevent your business from operating, resulting in the payment of a fee to recover your most viable asset – your data. Often the payment is in the form of digital currency which also results in more cost for the business.

Security and Analytics has the skills to aid in the hardening of your business network and operations and in the reduction of vulnerabilities that can lead to a successful attack by threat actors.

DATA ANALYTICS

Today more companies are interested in learning about how their data can be used to enhance market share and to provide insight into how to enhance operational efficiency. Security and Analytics is skilled in the development of applications and the recommendation of solutions to your Big Data issues. Customized software can be developed or Security and Analytics can make recommendations concerning open source and commercial analytical tools. These tools include the use of Microsoft Excel for data analytics and business modeling.

Additional data related skills include the use of the Cloud for data storage and analytics.

HOW TO GET IN TOUCH

There are multiple ways to get in touch with Security and Analytics, LLC.
